You Must Have Vitamins A and D

You must have Vitamin A as an aid in protection against infections which are more likely to occur in the nose, throat, eyes, ears and sinuses, when there is a deficiency of this vitamin.

You need Vitamin D to help the body make proper use of the calcium and phosphorus in your diet.

If you are not getting enough of these two important vitamins, A PENNY A DAY will insure adequate intake, if you take

The American BANKING System Democracy at its Best

There are some 10,000 American banks, each owned and operated by local citizens. Separate in a sense yet they are knit together into one great system by the common aim of service. Responsive to the needs of each community, yet they are geared to meet the nation's needs instantly in its hour of crisis. There's nothing like it elsewhere; it's the savvy of every other country; it's democracy functioning at its very best.

standing for further growth. This owner expects to realize \$20 an acre for the present cut, approximately the same amount ten or twelve years hence for another partial cut, and a final cutting for sawlogs some 25 or 30 years from now, which should raise the total income to \$150 an acre. This is the kind of thing all farmers should be doing.

PAPER INDUSTRY MOVES SOUTH

We frequently hear the statement that the paper industry is moving South. This may not be strictly true, but it certainly is a fact that there has been a tremendous increase recently in the number and size of pulp and paper plants operating in the Southern pine territory. Twelve large and up-to-date plants are just getting into production from Virginia around to Texas and Arkansas; these are in addition to a large number which have been in operation for many years.

Paper making is not a new industry in Virginia. Eight plants located at Hopewell, West Point, Lynchburg, Big Island, Covington, Buena Vista, Franklin and Bristol, have been making paper from Virginia woods for many years. While these plants offer a pulpwood market, they also cause problems to agriculture which have plagued both producer and consumer in sections of this State, of the South and the country. An official of a large paper company in Quebec told the writer recently that the spruce timber they are now cutting is so far away that it requires two and a half years to get it to the mill. (This wood is all floated in). That delay makes expensive wood and reduces the amount that can be allowed by stumpage. How much better it would have been had that paper company reforested their close-in land as it was cut; then built a second plant close to the distant timber. They are reforesting now, but at a rate and cost which would stagger us here in the South.

But even in the South, where pines grow so rapidly, the same thing has happened time after time. Operators of large pulp mills which have been operating in Louisiana since before the World War, suddenly awoke to the fact that nearby timber was practically exhausted—not because new timber would not grow, but because it had not been given a chance. To him, up a supply of wood would carry them while they reforested and while the new crop was growing, this company sent a large 150 miles in Texas. He quietly bought up timber rights for as little as \$3 an acre; moving every thing on the land; and getting a long term of years in which to remove it. Much of the land had stands ranging from 10 to 20 cords an acre, making a stumpage price of 15 to 30 cents a cord for the present profitable stand, and looking for the which grows while cutting right last. And the farmer was to continue to pay taxes.

By way of contrast: The writer also knows of a recent pulpwood sale in Clarke City county where the purchaser not only raised his offer from \$1 to \$2 a cord, but agreed to use the partial cutting principle, by which more than half of the present stand is to be left

standing for further growth. This owner expects to realize \$20 an acre for the present cut, approximately the same amount ten or twelve years hence for another partial cut, and a final cutting for sawlogs some 25 or 30 years from now, which should raise the total income to \$150 an acre. This is the kind of thing all farmers should be doing.

SAYLOR'S CREEK

Governor Price has authorized the release of an appropriation of \$25,000 to buy land at Saylor's Creek, scene of a battle in the War Between the States, for development as a battlefield park.

A force of WPA workers is making a survey of the number of trucks and buses in Virginia, to be used by the Federal government in case of emergency. It is estimated that approximately 110,000 such vehicles are registered.

Richmond cigarette plants produced more than one-third of all cigarettes manufactured in the United States during August.

Appomattox is a growing town.

FARMERS FACE PROBLEMS IN HIGHER PRODUCTION

Still higher goals of production, especially in milk, pork, poultry and beef have been set for Virginia farmers in 1942, and attaining these goals will create many problems. There will, of course, be the problem of shifts in production. Some localities will have difficulty in finding farm labor. More equipment and more fertilizer will be needed. Social changes are likely to take place. There are but a few of the highly important problems that Virginia farmers are facing, says John R. Hutchinson, director, Virginia Agricultural Extension Division; and already steps are being taken toward finding the right answers.
